EpiLaze

Laser Hair Removal

The EpiLaze is the ultimate solution for laser hair removal. The EpiLaze contains the 3 "Gold Standard" laser wavelengths (Alexandrite, 810-Diode and Yag) that can permanently reduce and remove unwanted body hair and facial hair on all types of skin.

Is Laser Hair Removal Safe?

The EpiLaze Laser is FDA Cleared for permanent hair reduction on all skin types including light, fair skin, olive skin and African American skin. The EpiLaze can remove/reduce dark, coarse hair and dark fine hair. Blonde, white and gray hair cannot be treated.

What Can I Expect During the Treatment?

The EpiLaze features built-in contact cooling that cools the treatment area before, during and after the treatment. Therefore, most patients experience little to no discomfort during the treatment. However, depending on the thickness of the hair, some patients may feel a warm sting (similar to a rubber band against their skin) as the laser energy penetrates into the hair follicle.

What Area on the Body Can Be Treated?

The EpiLaze laser can quickly, safely and effectively remove or reduce unwanted body hair on all areas of the body including the face, chin, upper lip, back, chest, legs and bikini area.

How Many Treatments are Required?

Hair follicles in the "growth stage" respond to laser hair removal. Not all follicles are active at the same time. To achieve the maximum result most patients normally require 3-8 treatment sessions. The treatment sessions are spread out every few weeks.

Recovery

Depending on the area treated, some swelling, or irritation may occur. However, most treatments have little to no downtime and few side effects.
